

The Diamond Carbide Wheel

You have purchased probably the best nail grinding wheel available today that is going to save you money, and the frustrations we all have with paper wheels breaking apart and smoothing out so quickly you cant use them any more. Use it on wet or dry nails successfully.

This wheel will fit your Dremel grinder, and fit any other grinder that takes a 1/8th in shaft on the mandrel.

You received a wheel installed on a mandrel. Take your mandrel off your grinder and install this one in its place. If you got the wheel only, or replacing this wheel on another mandrel. Take your wheel off your mantle, then wipe it off with a rag to clean it good.

Put a half drop of blade oil on the end of your finger and wipe it around your mantle, you just want it to lightly lube the mantle.

Carefully, without squeezing the wheel, slide the wheel onto your mantle. Push down far enough so a tiny bit of the black mantle is visible above the wheel. Don't need much.

The wheel is 150 grit, and has less vibration and is quieter than the paper drums. Use on wet and dry nails or right in the tub, as water actually helps.

Clean the wheel periodically using a toothbrush with soap and water. (NO METAL BRUSH), or you will ruin it. If you don't clean it now and then the dust will build up and it may stop cutting.

Note: Do not use this wheel for anything other than nails, HEAT: If you think the wheel is getting too hot. Have a can of computer cleaner (air), turn it upside down and spray the wheel. It will ice it immediately. You can also stop the Dremel and stick the wheel in a glass of water to cool or water in the tub. If you let the wheel get scorching hot it can melt the mandrel.
